About Bharat Computer Institute

Bharat Computer Institute, located on Rohtak Road, Jhajjar, Haryana, is a training centre offering vocational and job-oriented computer courses — branding itself as “Jhajjar's Most Trusted Computer Institute.”

The internship was certified by the E-Max Council for Vocational Training and Education — an autonomous body registered under the SR Act, Section 9(1), 2012 (Govt. Regn. No. HR/KKR/2015/00328) — covering a structured 120-hour Web Development programme.

The Problem Statement

Bharat Computer Institute needed a modern, mobile-responsive website to reach prospective students, present its certification programmes (Certificate, Diploma, and Advance Diploma courses), and build credibility as “Jhajjar's Most Trusted Computer Institute.”

This project set out to design and build such a website end-to-end — from front-end pages through to a working backend that stores enquiries in a database — and deploy it so it is publicly accessible.

Live at: bharat-computer-institute-jhajjar.netlify.app

Project Objectives

Design a responsive, multi-page institute website using semantic HTML5 and CSS3

Add interactivity (navigation, form validation, dynamic content) using JavaScript

Build a Node.js backend accepting enquiry submissions via simple API routes

Design a MySQL schema to store enquiries and connect it to the backend

Use Python for small supporting/automation scripts during development

Deploy the completed website to production on Netlify and verify it live

Technologies & Tools Used

HTML5 & CSS3

Semantic structure and responsive
Flexbox/Grid layout

JavaScript

DOM manipulation, form validation, fetch
API

Node.js + Express

Backend runtime and REST-style API routes

MySQL

Stores enquiry/contact-form submissions

Python

Supporting scripts for data formatting & API
testing

Netlify

Live production deployment

VS Code

Development environment

Git & GitHub

Version control and source repository

Architecture & Deployment Flow

The front end runs in the browser and calls a Node.js/Express API over HTTP, which validates and stores enquiries in MySQL. The finished code is pushed to GitHub and deployed live on Netlify.

Development Methodology

Testing & Expected Outcomes

The website was tested across desktop and mobile screen sizes to confirm responsive behaviour. The contact form was tested with valid and invalid inputs, and the live Netlify deployment was checked to ensure it matched local testing behaviour.

-  A working, responsive institute website built with HTML, CSS, and JavaScript
-  A functioning Node.js/Express backend that accepts and processes form submissions
-  A MySQL database correctly storing form data submitted through the website
-  Supporting Python scripts used for testing and data handling during development
-  A live, publicly accessible deployment of the website on Netlify

Key Learnings & Takeaways

Front-End Development

Responsive layout design, semantic HTML, CSS Flexbox/Grid, JavaScript DOM handling and form validation

Back-End Development

Building REST-style API routes with Node.js/Express, connecting to and querying a MySQL database

Tools & Deployment

Git/GitHub workflow, using Python for supporting scripts, deploying and configuring a live site on Netlify
